- (54) Phthalic acid diamide derivatives, agricultural and horticultural insecticides, and a method for application of the insecticides
- (57) The present invention provides a phthalic acid diamide derivative represented by the general formula (I),

[wherein R<sup>1</sup>, R<sup>2</sup> and R<sup>3</sup> may be same or different, and are each a hydrogen atom, a cyano group, a  $C_3$ - $C_6$  cycloalkyl group, a  $C_3$ - $C_6$  cycloalkenyl group, a halo- $C_3$ - $C_6$  cycloalkenyl group, or a group of the formula -A<sup>1</sup>- $Q_\ell$ ; X may be the same or different and are each a hydrogen atom, a halogen atom, a cyano group, a nitro group, a phenyl group, a substituted phenyl group, a naphthyl group, a substituted naphthyl group, a heterocyclic group, a substituted heterocyclic group; or a group of the formula -A<sup>2</sup>-R<sup>7</sup>;  $\underline{n}$  is an integer of 1 to 4; Y may be same or different and are each a hydrogen atom, a halogen atom, a cyano group, a nitro group, a phenyl group, a substituted phenyl group, a naphthyl group, a substituted naphthyl group, a heterocyclic group, a substituted heterocyclic group or a group of the formula -A<sup>2</sup>-R<sup>7</sup>;  $\underline{m}$  is an integer of 1 to 5;  $Z^1$  and  $Z^2$  are each an oxygen atom or a sulfur atom}, and an agricultural and horticultural insecticide containing said phthaldiamide derivative, as well as to provide a method for use of said insecticide.

The agricultural and horticultural insecticides of the present invention show excellent activities for controlling injurious insects.

#### Description

#### BACKGROUND OF THE INVENTION

#### 5 FIELD OF THE INVENTION

[0001] The present invention relates to phthalic acid diamide derivatives, agricultural and horticultural insecticides containing said derivative as an active ingredient, and a method for application of the insecticides.

[0002] Japanese Patent Application Nos. 59-163353 and 61-180753 and J.C.S. Perkin I, 1338-1350, (1978), etc. disclose some of the phthalic acid diamide derivatives of the present invention but neither describe nor suggest their usefulness as agricultural and horticultural insecticides.

#### SUMMARY OF THE INVENTION

[0003] The present inventors earnestly studied in order to develop a novel agricultural and horticultural insecticide, and consequently found that the phthalic acid diamide derivatives represented by the general formula (I) of the present invention are novel compounds not known as agricultural and horticultural insecticides in any literature and that said derivatives including the compounds disclosed in the above references can be used for a new purpose as agricultural and horticultural insecticides. Thus, the present invention has been accomplished.

## **DETAILED DESCRIPTION OF THE INVENTION**

[0004] The present invention relates to phthalic acid diamide derivatives of the general formula (I),

agricultural and horticultural insecticides containing as an active ingredient any of the phthalic acid diamide derivatives of the general formula (I) including known compounds; and a method for application of the insecticides.

- [0005] In the definition of the general formula (I) representing the phthalic acid diamide derivative of the present invention, the halogen atom includes chlorine atom, bromine atom, iodine atom and fluorine atom. The term "C<sub>1</sub>-C<sub>6</sub> alkyl" means a linear or branched alkyl group of 1 to 8 carbon atoms, such as methyl, n-propyl, i-propyl, i-propyl, i-butyl, s-butyl, n-pentyl, n-hexyl, or the like. The term "C<sub>1</sub>-C<sub>8</sub> alkylene" means a linear or branched alkylene group of 1 to 8 carbon atoms, such as methylene, ethylene, propylene, trimethylene, dimethylene, tetramethylene, i-butylene, dimethylethylene, pentamethylene, hexamethylene, heptamethylene, octamethylene or the like. The term "halo-C<sub>1</sub>-C<sub>6</sub> alkyl" means a substituted and linear or branched alkyl group of 1 to 6 carbon atoms having as the substituent(s) one or more halogen atoms which may be the same or different.
- [0006] As the ring which R<sup>1</sup> and R<sup>2</sup> form by combining to each other, i.e., the 4- to 7-membered ring by combining to each other, in which the ring may contain the same or different 1 to 3 hetero atoms selected from the group consisting of oxygen atom, sulfur atom and nitrogen atom, there can be exemplified azetidine ring, pyrrolidine ring, pyrroline ring, piperidine ring, imidazolidine ring, imidazolidine ring, oxazolidine ring, thiazolidine ring, isoxazolidine ring, dithiazine ring, etc.
- [0007] The phthalic acid diamide derivative of the general formula (I) of the present invention contains an asymmetric carbon atom or some asymmetric center in the structural formula in some cases or has two optical isomers in some cases. The present invention includes these optical isomers and all mixtures containing the optical isomers in arbitrary proportions.
- [0008] Preferable examples of each substituent of the phthalic acid diamide derivative of the general formula (I) of the present invention are as follows. Preferable examples of each of R¹ and R² which may be the same or different are hydrogen atom, C₁-C₆ alkyl groups such as methyl, ethyl, i-propyl, etc. Preferable examples of R³ are hydrogen atom, and C₁-C₆ alkyl groups such as methyl, ethyl, n-propyl, i-propyl, n-butyl, etc. Preferable examples of x are halogen atoms, nitro group, halo-C₁-C₆ alkyl groups, halo-C₁-C₆ alkoxy groups, halo-C₁-C₆ alkylthio groups, etc. Preferable examples of Y are halo-C₁-C₆ alkyl groups, halo-C₁-C₆ alkoxy groups, halo-C₁-C₆ alkylthio groups, etc.
  - [0009] The phthalic acid diamide derivative of the general formula (I) of the present invention can be produced, for example, by any of the processes illustrated below.

[0012] As the inert solvent used in this reaction, any solvent may be used so long as it does not markedly inhibit the progress of the reaction. There can be exemplified aromatic hydrocarbons such as benzene, toluene, xylene, etc.; halogenated hydrocarbons such as dichloromethane, chloroform, carbon tetrachloride, etc., chlorinated aromatic hydrocarbons such as chlorobenzene, dichlorobenzene, etc.; a cyclic or cyclic ethers such as diethyl ether, dioxane, tetrahydrofuran, etc., esters such as ethyl acetate, etc.; amides such as dimethylformamide, dimethylacetamide, etc.; acids such as acetic acid, etc.; dimethyl sulfoxide; and 1,3-dimethyl-2-imidazolidinone. These inert solvents may be used alone or as a mixture thereof.

[0013] Since the reaction is an equimolar reaction, it is sufficient that the reactants are used in equimolar amounts, though either of them may be used in excess. If necessary, the reaction may be carried out under dehydrating conditions.

[0014] As to the reaction temperature, the reaction can be carried out in a temperature range of room temperature to the reflux temperature of the inert solvent used. Although the reaction time is varied depending on the scale of reaction, the reaction temperature, etc., it may be properly chosen in a range of several minutes to 48 hours.

[0015] After completion of the reaction, the desired compound is isolated from the reaction solution containing the desired compound by a conventional method, and if necessary, purified by recrystallization, column chromatography, etc., whereby the desired compound can be produced. The desired compound can be subjected to the subsequent reaction without isolation from the reaction solution.

[0016] The phthalic anhydride derivative of the general formula (V) can be produced by the process described in J. Org. Chem., 52, 129 (1987), J. Am. Chem. Soc., 51, 1865 (1929), J. Am. Chem. Soc., 63, 1542 (1941), etc. The aniline of the general formula (IV) can be produced by the process described in J. Org. Chem., 29, 1 (1964), Angew. Chem. Int. Ed. Engl., 24, 871 (1985), Synthesis, 1984, 667, Bulletin of the Chemical Society of Japan, 1973, 2351, DE-2606982, JP-A-1-90163, etc.

(2) General formula (III) → general formula (I-1)

[0017] In this reaction, there can be used the inert solvents exemplified above as the inert solvent used in the reaction (1).

[0018] Since the reaction is an equimolar reaction, it is sufficient that the reactants are used in equimolar amounts, though the amine of the general formula (II) may be used in excess.

[0019] As to the reaction temperature, the reaction can be carried out in a temperature range of room temperature to the reflux temperature of the inert solvent used. Although the reaction time is varied depending on the scale of reaction, the reaction temperature, etc., it may be properly chosen in a range of several minutes to 48 hours.

[0028] Any solvent may be used in this reaction so long as it does not markedly inhibit the progress of the reaction. There can be exemplified alcohols such as methanol, ethanol, propanol, etc.; acyclic or cyclic ethers such as diethyl ether, dioxane, tetrahydrofuran, etc., and acids such as acetic acid, etc. These inert solvents may be used alone or as a mixture thereof.

[0029] As the catalyst for catalytic reduction used in this reaction, there can be exemplified palladium carbon, Raney nickel, palladium black, platinum black, etc. The amount of the catalyst used may be properly chosen in a range of 0.1 to 10% by weight based on the weight of the phthalimide derivative of the general formula (III-2). This reaction is carried out under a hydrogen atmosphere and the hydrogen pressure may be properly chosen in a range of 1 to 10 atmospheric pressure.

[0030] As to the reaction temperature, the reaction can be carried out in a temperature range of room temperature to the reflux temperature of the inert solvent used. Although the reaction time is varied depending on the scale of reaction, the reaction temperature, etc., it may be properly chosen in a range of several minutes to 48 hours.

[0031] After completion of the reaction, the desired compound is isolated from the reaction mixture containing the desired compound by a conventional method, and if necessary, purified by recrystallization, column chromatography, etc., whereby the desired compound can be produced. The desired compound can be subjected to the subsequent reaction without isolation from the reaction mixture.

[0032] In this reaction, an acidic solvent can be used as an inert solvent. The acidic solvent includes, for example, an aqueous hydrochloric acid solution, an aqueous hydrochloric acid solution, an aqueous hydrochloric acid solution, acetic acid and trifluoroacetic acid. These acidic solvents may be used alone or as a mixture thereof. In addition, these acidic solvents may be used in admixture with ethers such as tetrahydrofuran, dioxane, etc.

[0033] The diazotizing agent includes, for example, sodium nitrite, nitrosyl hydrogensulfate and alkyl nitrites. The amount of the diazotizing agent used may be properly chosen in a range of equal amount to excess amount relative to the amount of the phthalimide derivative of the general formula (III-3).

[0034] As to the reaction temperature, the reaction can be carried out in a temperature range of -50°C to the reflux temperature of the inert solvent used. Although the reaction time is varied depending on the scale of reaction, the reaction temperature, etc., it may be properly chosen in a range of several minutes to 48 hours.

[0035] As the metal salt added after the production of a diazonium salt, there can be used, for example, cuprous chloride, cuprous bromide, potassium iodide, copper cyanide, potassium xanthate and sodium thiorate. The amount of the metal salt used may be properly chosen in a range of 1 equivalent to excess equivalents per equivalent of the phthalimide derivative of the general formula (III-3).

[0036] After completion of the reaction, the desired compound is isolated from the reaction mixture containing the desired compound by a conventional method, and if necessary, purified by recrystallization, column chromatography, etc., whereby the desired compound can be produced. The desired compound can be subjected to the subsequent reaction without isolation from the reaction mixture.

[0045] A phthalic anhydride derivative of the general formula (V) is reacted with an amine of the general formula (II)

in the presence of an inert solvent to obtain a phthalamide of the general formula (III-4). The phthalamide (III-4) is treated as follows after or without isolation. When R<sup>2</sup> of the phthalamide (III-4) is a hydrogen atom, the phthalamide (III-4) is condensed into a compound of the general formula (VI) in the presence of a condensing agent, and the compound (VI) is reacted with an aniline of the general formula (IV) in the presence of an inert solvent after or without being isolated. When R<sup>2</sup> of the phthalamide (III-4) is other than a hydrogen atom, the phthalamide (III-4) is condensed with an aniline of the general formula (IV) in the presence of a condensing agent. Thus, a phthalic acid diamide derivative of the general formula (I) can be produced.

[0046] Alternatively, a phthalic anhydride derivative of the general formula (V) is reacted with an aniline of the general formula (IV) in the presence of an inert solvent to obtain a phthalanilide of the general formula (III-5). The phthalanilide (III-5) is treated as follows after or without isolation. When R³ of the phthalanilide (III-5) is a hydrogen atom, the phthalanilide (III-5) is condensed into a compound of the general formula (VI-1) in the presence of a condensing agent, and the compound (VI-1) is reacted with an amine of the general formula (II) in the presence of an inert solvent after or without being isolated. When R³ of the phthalanilide (III-5) is other than a hydrogen atom, the phthalanilide (III-5) is condensed with an amine of the general formula (II) in the presence of a condensing agent. Thus, a phthalic acid diamide derivative of the general formula (I) can be produced.

If necessary, the reaction can be carried out in the presence of a base.

[0051] The inert solvent used in the reaction includes, for example, tetrahydrofuran, diethyl ether, dioxane, chloroform and dichloromethane. As the condensing agent used in the reaction, any condensing agent may be used so long as it is used in usual amide synthesis. The condensing agent includes, for example, Mukaiyama reagent (e.g. 2-chloro-N-methylpyridinium iodide), 1,3-dicyclohexylcarbodiimide (DCC), carbonyldiimidazole (CDI) and diethyl phosphorocyanidate (DEPC). The amount of the condensing agent used may be properly chosen in a range of 1 mole to excess moles per mole of the phthalamide derivative of the general formula (III-4) or the general formula (III-5).

[0052] As the base usable in the reaction, there can be exemplified organic bases such as triethylamine, pyridine, etc. and inorganic bases such as potassium carbonate, etc. The amount of the base used may be properly chosen in a range of 1 mole to excess moles per mole of the phthalamide derivative of the general formula (III-4) or the general formula (III-5).

[0053] As to the reaction temperature, the reaction can be carried out in a temperature range of 0°C to the boiling point of the inert solvent used. Although the reaction time is varied depending on the scale of reaction, the reaction temperature, etc., it ranges from several minutes to 48 hours.

[0054] After completion of the reaction, the desired compound is isolated from the reaction solution containing the desired compound by a conventional method, and if necessary, purified by recrystallization, column chromatography, etc., whereby the desired compound can be produced.

The compound thus obtained is directly reacted with an isocyanate or isothiocyanate derivative of the general formula (IX-1) or (IX-2), or the compound is reacted with carbon dioxide to obtain a phthalamide derivative of the general formula (III-4) or the general formula (III-5), which is treated in the same manner as in production processes 5-(1) to 5-(4). Thus, a phthalic acid diamide derivative of the general formula (I) can be produced.

(1) General formula (VIII-1) or general formula (VIII-2) → general formula (VIII-3) or general formula (VIII-4), respectively

[0075] The desired compound can be produced by this reaction according to the method described in J. Org. Chem., 46, 3558 (1981).

(2) General formula (VIII-1), general formula (VIII-2), general formula (VIII-3) or general formula (VIII-4)  $\rightarrow$  general formula (I)

[0076] In this step, the benzamide derivative of the general formula (VIII-1) or the general formula (VIII-2) or the thiobenzamide derivative of the general formula (VIII-3) or the general formula (VIII-4) obtained by thiocarbonylation of the benzamide derivative of the general formula (VIII-1) or the general formula (VIII-2), respectively, is subjected to ortho-lithiation according to the method described in J. Org. Chem., 29, 853 (1964). The compound thus obtained is reacted with the isocyanate or isothiocyanate derivative of the general formula (IX-1) or (IX-2) at -80°C to room temperature, whereby the desired compound can be produced.

[0077] After completion of the reaction, the desired compound is isolated from the reaction solution containing the desired compound by a conventional method, and if necessary, purified by recrystallization, column chromatography, etc., whereby the desired compound can be obtained.

[0079] After completion of the reaction, the desired compound is isolated from the reaction solution containing the desired compound by a conventional method, and if necessary, purified by recrystallization, column chromatography, etc., whereby the desired compound can be obtained.

(4) General formula (III-4') or general formula (III-5')  $\rightarrow$  general formula (I)

[0080] In this step, the desired compound can be produced in the same manner as in production process 1-(2) or 5-(4).

[0081] Tables 1 and 2 show typical examples of the phthalic acid diamide derivative of the general formula (I) used as the active ingredient of the agricultural and horticultural insecticide of the present invention, but the examples are not intended in any way to limit the scope of the present invention.

[0085] Agricultural and horticultural insecticides containing the phthalic acid diamide derivative of the general formula (I) of the present invention as an active ingredient are suitable for controlling various insect pests such as agricultural insect pests, forest insect pests, horticultural insect pests, stored grain insect pests, sanitary insect pests, nematodes, etc., which are injurious to paddy rice, fruit trees, vegetables, other crops, flowers and ornamental plants, etc. They have a marked insecticidal effect, for example, on LEPIDOPTERA including summer fruit tortrix (Adoxophyes orana fasciata), smaller tea tortrix (Adoxophyes sp.), Manchurian fruit moth (Grapholita inopinata), oriental fruit moth (Grapholita molesta), soybean pod border (Leguminivora glycinivorella), mulberry leafroller (Olethreutes mori), tea leafroller (Caloptilia thevivora), Caloptilia sp. (Calopilia zachrysa), apple leafminer (Phyllonorycter ringoniella), pear barkminer (Spulerrina astaurota), common white (Piers rapae crucivora), tabacco budworm (Heliothis sp.), codling moth (Laspey resia pomonella), diamondback moth (Plutella xylostella), apple fruit moth (Argyresthia conjugella), peach fruit moth (Carposina niponensis), rice stem borer (Chilo suppressalis), rice leafroller (Cnaphalocrocis medinalis), tabacco moth (Ephestia elutella), mulberry pyralid (Glyphodes pyloalis), yellow rice borer (Scirpophaga incertulas), rice skipper (Parnara guttata), rice armyworm (Pseudaletia separata), pink borer (Sesamia inferens), common cutworm (Spodoptera litura), beet armyworm (Spodoptera exigua), etc.; HEMIPTERA including aster leafhopper (Macrosteles fascifrons), green rice leafhopper (Nephotettix cincticeps), brown rice planthopper (Nilaparvata lugens), whitebacked rice planthopper (Sogatella furcifera), citrus psylla (Diaphorina citri), grape whitefly (Aleurolobus taonabae), sweetpotato whitefly (Bemisia tabaci), greenhouse whitefly (Trialeurodes vaporariorum), turnip aphid (Lipaphis erysimi), green peach aphid (Myzus persicae), Indian wax scale (Ceroplastes ceriferus), cottony citrus scale (Pulvinaria aurantii), camphor scale (Pseudaonidia duplex), San Jose scale (Comstockaspis perniciosa), arrowhead scale (Unaspis yanonensis), etc.; COLEOPTERA including soybean beetle (Anomala rufocuprea), Japanese beetle (Popillia japonica), tabacco beetle (Lasioderma serricorne), powderpost beetle (Lyctus brunneus), twenty-eight spotted ladybird (Epilachna vigintiotopunctata), adzuki bean weevile (Callosobruchus chinensis), vegetable weevil (Listroderes costirostris), maize weevil (Sitophilus zeamais), boll weevil (Anthonomus gradis gradis), rice water weevil (Lissorhoptrus oryzophilus), cucurbit leaf beetle (Aulacophora femoralis), rice leaf beetle (Qulema oryzae), striped flea beetle (Phyllotreta striolata), pine

shoot beetle (<u>Tomicus piniperda</u>), Colorado potato beetle (<u>Leptinotarsa decemlineata</u>), Mexican bean beetle (<u>Epilachna varivestis</u>), corn rootworm (<u>Diabrotica sp.</u>), etc.; DIPTERA including melon fly (<u>Dacus(Zeugodacus</u>) <u>cucurbitae</u>), oriental fruit fly (<u>Dacus(Bactrocera</u>) <u>dorsalis</u>), rice leafminer (<u>Agnomyza oryzae</u>), onion maggot (<u>Delia antiqua</u>), seedcorn maggot (<u>Delia platura</u>), soybean pod gall midge (<u>Asphondylia sp.</u>), muscid fly (<u>Musca domestica</u>), house mosquito (<u>Culex pipiens pipiens</u>), etc.; and TYLENCHIDA including root-lesion nematode (<u>Pratylenchus sp.</u>), coffer root-lesion nematode (<u>Pratylenchus coffeae</u>), potato cyst nematode (<u>Globodera rostochiensis</u>), root-knot nematode (<u>Meloidogyne sp.</u>), citrus nematode (<u>Tylenchulus semipenetrans</u>), Aphelenchus sp. (<u>Aphelenchus avenae</u>), chrysanthemum foliar (<u>Aphelenchoides ritzemabosi</u>), etc.

[0086] The agricultural and horticultural insecticide containing the phthalic acid diamide derivative of the general formula (I) of the present invention as an active ingredient has a marked insecticidal effect on the above-exemplified insect pests, sanitary insect pests, and/or nematodes, which are injurious to paddy field crops, upland crops, fruit trees, vegetables, other crops, flowers and ornament plants, and the like. Therefore, the desired effect of the agricultural and horticultural insecticide of the present invention can be obtained by applying the insecticide to the paddy field water, stalks and leaves of fruit trees, vegetables, other crops, flowers and ornament plants, soil, etc. at a season at which the insect pests, sanitary pests or nematodes are expected to appear, before their appearance or at the time when their appearance is confirmed.

[0087] In general, the agricultural and horticultural insecticide of the present invention is used after being prepared into conveniently usable forms according to an ordinary manner for preparation of agrochemicals.

[0088] That is, the phthalic acid diamide derivative of the general formula (I) and, optionally, an adjuvant are blended with a suitable inert carrier in a proper proportion and prepared into a suitable preparation form such as a suspension, emulsifiable concentrate, soluble concentrate, wettable powder, granules, dust or tablets through dissolution, dispersion, suspension, mixing, impregnation, adsorption or sticking.

[0089] The inert carrier used in this invention may be either solid or liquid. As the solid carrier, there can be exemplified soybean flour, cereal flour, wood flour, bark flour, saw dust, powdered tobacco stalks, powdered walnut shells, bran, powdered cellulose, extraction residues of vegetables, powdered synthetic polymers or resins, clays (e.g. kaolin, bentonite, and acid clay), talcs (e.g. talc and pyrophyllite), silica powders or flakes (e.g. diatomaceous earth, silica sand, mica and white carbon, i.e. synthetic, high-dispersion silicic acid, also called finely divided hydrated silica or hydrated silicic acid, some of commercially available products contain calcium silicate as the major component), activated carbon, powdered sulfur, powdered pumice, calcined diatomaceous earth, ground brick, fly ash, sand, calcium carbonate powder, calcium phosphate powder and other inorganic or mineral powders, chemical fertilizers (e.g. ammonium sulfate, ammonium phosphate, ammonium nitrate, urea and ammonium chloride), and compost. These carriers may be used alone or as a mixture thereof.

[0090] The liquid carrier is that which itself has solubility or which is without such solubility but is capable of dispersing an active ingredient with the aid of an adjuvant. The following are typical examples of the liquid carrier and can be used alone or as a mixture thereof. Water; alcohols such as methanol, ethanol, isopropanol, butanol and ethylene glycol; ketones such as acetone, methyl ethyl ketone, methyl isobutyl ketone, diisobutyl ketone and cyclohexanone; ethers such as ethyl ether, dioxane, Cellosolve, dipropyl ether and tetrahydrofuran; aliphatic hydrocarbons such as kerosene and mineral oils; aromatic hydrocarbons such as benzene, toluene, xylene, solvent naphtha and alkylnaphthalenes; halogenated hydrocarbons such as dichloroethane, chloroform, carbon tetrachloride and chlorobenzene; esters such as ethyl acetate, diisopropyl phthalate, dibutyl phthalate and dioctyl phthalate; amides such as dimethylformamide, diethylformamide and dimethylacetamide; nitriles such as acetonitrile; and dimethyl sulfoxide.

[0091] The following are typical examples of the adjuvant, which are used depending upon purposes and used alone or in combination in some cases, or need not to be used at all.

[0092] To emulsify, disperse, dissolve and/or wet an active ingredient, a surfactant is used. As the surfactant, there can be exemplified polyoxyethylene alkyl ethers, polyoxyethylene alkylaryl ethers, polyoxyethylene higher fatty acid esters, polyoxyethylene resinates, polyoxyethylene sorbitan mono-laurate, polyoxyethylene sorbitan monooleate, alkylarylsulfonates, naphthalenesulfonic acid condensation products, ligninsulfonates and higher alcohol sulfate esters.

[0093] Further, to stabilize the dispersion of an active ingredient, tackify it and/or bind it, there may be used adjuvants such as casein, gelatin, starch, methyl cellulose, carboxymethyl cellulose, gum arabic, polyvinyl alcohols, turpentine, bran oil, bentonite and ligninsulfonates.

[0094] To improve the flowability of a solid product, there may be used adjuvants such as waxes, stearates and alkyl phosphates.

[0095] Adjuvants such as naphthalenesulfonic acid condensation products and polycondensates of phosphates may be used as a peptizer for dispersible products.

[0096] Adjuvants such as silicon oils may also be used as a defoaming agent.

[0097] The content of the active ingredient may be varied as required. In dusts or granules, the suitable content thereof is from 0.01 to 50% by weight. In emulsifiable concentrates or flowable wettable powders, it is also from 0.01 to 50% by weight.

[0098] The agricultural and horticultural insecticide of the present invention is used to control a variety of insect pests in the following manner. That is, it is applied to a crop on which the insect pests are expected to appear or a site where the appearance of the insect pests is undesirable, as it is or after being properly diluted with or suspended in water or the like, in an amount effective for control of the insect pests.

- [0099] The applying dosage of the agricultural and horticultural insecticide of the present invention is varied depending upon various factors such as a purpose, insect pests to be controlled, a growth state of a plant, tendency of insect pests appearance, weather, environmental conditions, a preparation form, an application method, an application site and an application time. It may be properly chosen in a range of 0.1 g to 10 kg (in terms of the active ingredient) per 10 ares depending upon purposes.
- [0100] The agricultural and horticultural insecticide of the present invention may be used in admixture with other agricultural and horticultural disease or pest controllers in order to expand both spectrum of controllable diseases and insect pest species and the period of time when effective applications are possible or to reduce the dosage.

[0101] Typical examples of the present invention are described below, but they should not be construed as limiting the scope of the invention.

Example 1

20 (1-1) Production of 3-chloro-N-[4-(1,1,2,2-tetrafluoroethoxy)-2-methylphenyl]phthalimide

[0102] In 10 ml of acetic acid were dissolved 0.55 g of 3-chlorophthalic anhydride and 0.67 g of 4-(1,1,2,2-tetrafluor-oethoxy)-2-methylaniline, and the reaction was carried out with heating under reflux for 3 hours. After completion of the reaction, the solvent was distilled off under reduced pressure and the resulting residue was washed with an ether-hexane mixed solvent to obtain 1.1 g of the desired compound.

Physical property: m.p. 121 - 122°C. Yield: 95%.

- (1-2) Production of 3-chloro-N<sup>1</sup>-[4-(1,1,2,2-tetrafluoroethoxy)-2-methylphenyl]-N<sup>2</sup>-isopropylphthalic acid diamide (compound No. 141) and 6-chloro-N<sup>1</sup>-[4-(1,1,2,2-tetrafluoroethoxy)-2-methylphenyl]-N<sup>2</sup>-isopropylphthalic acid diamide (compound No. 239)
- [0103] In 10 ml of dioxane was dissolved 1.1 g of 3-chloro-N-[4-(1,1,2,2-tetrafluoroethoxy)-2-methylphenyl] phthalimide, followed by adding thereto 0.5 g of isopropylamine, and the reaction was carried out at 80°C for 3 hours. After completion of the reaction, the solvent was distilled off under reduced pressure and the resulting residue was purified by a silica gel column chromatography using a hexane/ethyl acetate (2/1) mixed solvent as an eluent, to obtain 0.4 g of the desired compound (compound No. 141) having an Rf value of 0.5 to 0.7 and 0.5 g of the other desired compound (compound No. 239) having an Rf value of 0.2 to 0.4.

(2-1) Production of N-(4-trifluoromethoxyphenyl)-3-nitrophthalimide

[0106] In 50 ml of acetic acid were dissolved 5.97 g of 3-nitrophthalic anhydride and 5.31 g of 4-trifluoromethoxy-aniline, and the reaction was carried out with heating under reflux for 3 hours. After completion of the reaction, the solvent was distilled off under reduced pressure and the resulting residue was washed with an ether-hexane mixed solvent to obtain 10.2 g of the desired compound.

Physical property: m.p. 149 - 150°C. Yield: 97%.

(2-2) Production of 3-amino-N-(4-trifluoromethoxyphenyl)phthalimide

[0107] In a pressure vessel were placed 10.0 g of N-(4-trifluoromethoxyphenyl)-3-nitrophthalimide, 100 ml of acetic acid and 0.5 g of 5% palladium carbon, and catalytic reduction with hydrogen was carried out at a hydrogen pressure of 5 kg/cm². After completion of the reaction, the catalyst was filtered off and the filtrate was concentrated under reduced pressure. The resulting residue was washed with an ether-hexane mixed solvent to obtain 9.0 g of the desired compound.

Physical property: m.p. 161 - 162°C.
Yield: 98%.

(2-3) Production of 3-bromo-N-(4-trifluoromethoxyphenyl)phthalimide

[0108] In 20 ml of acetic acid was dissolved 1.6 g of 3-amino-N-(4-trifluoromethoxyphenyl)phthalimide, and a solution of 0.35 g of sodium nitrite in 5 ml of concentrated sulfuric acid was added dropwise while maintaining the temperature at 15°C or lower. The resulting mixture was stirred at 15°C or lower for another 20 minutes to obtain a diazonium salt. The diazonium salt was slowly added to a mixture of a solution of 0.86 g of cuprous bromide in 50 ml of hydrobromic acid and 10 ml of toluene which was maintained at 80°C. The resulting mixture was stirred until foaming ceased. After completion of the reaction, the organic layer was washed with an aqueous sodium thiosulfate solution and an aqueous sodium chloride solution, dried over anhydrous magnesium sulfate, and then distilled under reduced pressure to remove the solvent, and the resulting residue was purified by a silica gel chromatography to obtain 1.3 g of the desired compound.

Physical property: m.p. 117 - 118°C. Yield: 67%.

(2-4) Production of 3-bromo-N<sup>1</sup>-(4-trifluoromethoxyphenyl)-N<sup>2</sup>-isopropylphthalic acid diamide (compound No. 262) and 6-bromo-N<sup>1</sup>-(4-trifluoromethoxyphenyl)-N<sup>2</sup>-isopropylphthalic acid diamide (compound No. 302)

[0109] From 1.3 g of 3-bromo-N-(4-trifluoromethoxyphenyl)phthalimide, 0.5 g of the desired compound (compound No. 262) and 0.7 g of the other desired compound (compound No. 302) were obtained in the same manner as in Example 1-2.

Compound No. 262:

[0110]

Physical property: m.p. 208 - 210°C. Yield: 33%.

Compound No. 302:

After completion of the reaction, the solvent was distilled off under reduced pressure and the resulting residue was washed with an ether-hexane mixed solvent to obtain 10.2 g of the desired compound.

Physical property: m.p. 163 - 164°C. Yield: 98%.

(3-2) Production of N<sup>1</sup>-(4-difluoromethoxy-2-methylphenyl)-N<sup>2</sup>-isopropyl-3-nitrophthalic acid diamide (compound No. 696)

[0113] In 100 ml of dioxane was dissolved 10 g of N-(4-difluoromethoxy-2-methylphenyl)-3-nitrophthalimide, followed by adding thereto 2.5 g of isopropylamine, and the reaction was carried out for 3 hours. After completion of the reaction, the solvent was distilled off under reduced pressure and the resulting residue was washed with either to obtain 4.0 g of the desired compound.

Physical property: m.p. 148 - 149°C. Yield: 86%.

(3-3) Production of 3-amino-N1-(4-difluoromethoxy-2-methylphenyl)-N2-isopropylphthalic acid diamide

[0114] In a pressure vessel were placed 5 g of N¹-(4-difluoromethoxy-2-methylphenyl)-N²-isopropyl-3-nitrophthalic acid diamide, 50 ml of acetic acid and 0.25 g of 5% palladium carbon, and catalytic reduction with hydrogen was carried out at a hydrogen pressure of 5 kg/cm². After completion of the reaction, the catalyst was filtered off and the filtrate was concentrated under reduced pressure. The resulting residue was washed with an ether-hexane mixed solvent to obtain 4.0 g of the desired compound.

Physical property: m.p. 148 - 149°C. Yield: 86%.

- 35 (3-4) Production of N<sup>1</sup>-(4-difluoromethoxy-2-methylphenyl)-3-iodo-N<sup>2</sup>-isopropylphthalic acid diamide (compound No. 387)
- [0115] In 20 ml of acetic acid was dissolved 1.89 g of 3-amino-N<sup>1</sup>-(4-difluoromethoxy-2-methylphenyl)-N<sup>2</sup>-isopropylphthalic acid diamide, and 1.5 g of concentrated sulfuric acid was added under ice-cooling. While maintaining the resulting solution at 15°C or lower, a solution of 0.35 g of sodium nitrite in 0.5 ml of water was added dropwise. The resulting solution was stirred at 15°C or lower for another 20 minutes to obtain a diazonium salt. The diazonium salt was slowly added to a mixture of 50 ml of an aqueous solution containing 1.0 g of potassium iodide and 50 ml of chloroform which was maintained at 40°C. The resulting mixture was stirred until foaming ceased. After completion of the reaction, the organic layer was washed with an aqueous sodium thiosulfate solution and an aqueous sodium chloride solution, dried over anhydrous magnesium sulfate, and then distilled under reduced pressure to remove the solvent, and the resulting residue was purified by a silica gel chromatography to obtain 0.8 g of the desired compound.

Physical property: m.p. 207 - 209°C. Yield: 33%.

5 (4-2) Production of 6-iodo-N-isopropyl-phthalic acid isoimide

[0117] In 10 ml of toluene was dissolved 0.45 g of 3-iodo-2-N-isopropyl-phthalamic acid, followed by adding thereto 0.85 g of trifluoroacetic anhydride, and the reaction was carried out with stirring for 30 minutes. After completion of the reaction, the solvent was distilled off under reduced pressure to obtain 0.43 g of the desired compound as a crude product. The obtained desired compound was used in the subsequent reaction without purification.

Physical property: m.p. 87.5 - 88.5°C.

(4-3) Production of 3-iodo-N<sup>1</sup>-(4-pentafluoroethyl-2-methylphenyl)-N<sup>2</sup>-isopropyl-phthalic acid diamide (compound No. 372)

[0118] In 10 ml of tetrahydrofuran was dissolved 0.43 g of the 6-iodo-N-isopropyl-phthalic acid isoimide obtained in 4-2, followed by adding thereto 0.30 g of 4-pentafluoroethyl-2-methylaniline, and the reaction was carried out with stirring for 1 hour. After completion of the reaction, the solvent was removed from the reaction solution by distillation under reduced pressure, and the resulting residue was washed with ether-n-hexane to obtain 0.70 g of the desired compound.

Physical property: m.p. 195 - 196°C. Yield: 95%.

(6-1) Production of N-isopropyl-3,4-dichlorophthalamic acid

[0122] In 30 ml of tetrahydrofuran was dissolved 2.32 g of N-isopropyl-3,4-dichlorobenzamide, and 21 ml of s-BuLi (0.96 M/L) was slowly added while maintaining the temperature at -70°C. The resulting mixture was stirred at -70°C for 30 minutes, after which the cooling bath was removed. An excess of carbon dioxide was introduced into the reaction solution, and the thus treated solution was stirred at room temperature for 30 minutes to carry out the reaction.

[0123] After completion of the reaction, the reaction solution was poured into water and acidified with diluted hydrochloric acid, and the desired compound was extracted with ethyl acetate. The extracted solution was dried over anhy-

drous magnesium sulfate and distilled under reduced pressure to remove the solvent, and the crystals thus obtained were washed with an ether-hexane mixed solvent to obtain 2.4 g of the desired compound.

Physical property: m.p. 155 - 156°C. Yield: 86.9%.

(6-2) Production of N-isopropyl-3,4-dichlorophthalic acid isoimide

[0124] In 10 ml of toluene was dissolved 0.41 g of N-isopropyl-3,4-dichlorophthalamic acid, followed by adding thereto 0.42 g of trifluoroacetic anhydride, and the reaction was carried out with stirring at room temperature for 30 minutes. After completion of the reaction, the solvent was distilled off under reduced pressure to obtain 0.39 g of the desired compound as a crude product. The obtained desired compound was used in the subsequent reaction without purification.

15 (6-3) Production of 3,4-dichloro-N¹-(4-pentafluoroethyl-2-methylphenyl)-N²-isopropylphthalic acid diamide (compound No. 1222)

[0125] In 10 ml of acetonitrile was dissolved 0.39 g of N-isopropyl-3,4-dichlorophthalic acid isoimide, followed by adding thereto 0.34 g of 4-pentafluoroethyl-2-methylaniline, and the reaction was carried out with stirring for 2 hours. After completion of the reaction, the reaction solution was maintained at 0°C for 10 minutes and the crystals precipitated were collected by filtration and washed with hexane to obtain 0.61 g of the desired compound.

Physical property: m.p. 208 - 209°C. Yield: 84.1%.

Production of 3-chloro-2-isopropylaminothiocarbonyl-N-(pentafluoroethyl-2-methylphenyl)benzamide (compound No. S-1)

[0126] In 20 ml of tetrahydrofuran was dissolved 1.06 g of N-(pentafluoroethyl-2-methylphenyl)-3-chlorobenzamide, and 7 ml of s-BuLi (0.96 M/L) was slowly added while maintaining the temperature at -70°C. The resulting mixture was stirred at -70°C for 30 minutes, after which the cooling bath was removed. A solution of 0.33 g of isopropyl isothiocyanate in 5 ml of tetrahydrofuran was poured into the reaction solution, and the resulting solution was stirred at room temperature for 30 minutes to carry out the reaction.

[0127] After completion of the reaction, the reaction solution was poured into water and acidified with diluted hydrochloric acid, and the desired compound was extracted with ethyl acetate. The extracted solution was dried over anhydrous magnesium sulfate and distilled under reduced pressure to remove the solvent, and the crystals thus obtained were washed with an ether-hexane mixed solvent to obtain 1.2 g of the desired compound.

Physical property: m.p. 162 - 164°C. Yield: 86%.

[0128] Typical preparation examples and test examples of the present invention are described below but they should not be construed as limiting the scope of the invention.

[0129] In the preparation examples, parts are all by weight.

Formulation Example 1

50 [0130]

Each compound listed in Table 1 50 parts

Xylene 40 parts

Mixture of polyoxyethylene nonylphenyl ether and calcium alkylbenzenesulfonate 10 parts

[0131] An emulsifiable concentrate was prepared by mixing uniformly the above ingredients to effect dissolution.

Formulation Example 2

*5* [0132]

10

Each compound listed in Table 1	3 parts
Clay powder	82 parts
Diatomaceous earth powder	15 parts

15 [0133] A dust was prepared by mixing uniformly and grinding the above ingredients.

Formulation Example 3

[0134]

20

25

Each compound listed in Table 1	5 parts
Mixed powder of bentonite and clay	90 parts
Calcium lignin sulfonate	5 parts

[0135] Granules were prepared by mixing the above ingredients uniformly, and kneading the resulting mixture together with a suitable amount of water, followed by granulation and drying.

Formulation Example 4

40

45

Each compound listed in Table 1	20 parts
Mixture of kaolin and synthetic high-dispersion silicic acid	75 parts
Mixture of polyoxyethylene nonylphenyl ether and calcium alkylbenzenesulfonate	5 parts

[0137] A wettable powder was prepared by mixing uniformly and grinding the above ingredients.

Test Example 1

Insecticidal effect on diamondback moth (Plutella xylostella)

[0138] Adult diamondback moths were released and allowed to oviposit on a Chinese cabbage seedling. Two days after the release, the seedling having eggs deposited thereon was immersed for about 30 seconds in a liquid chemical prepared by diluting a preparation containing each compound listed in Table 1 as an active ingredient to adjust the concentration to 500 ppm. After air-drying, it was allowed to stand in a room thermostated at 25°C. Six days after the immersion, the hatched insects were counted. The mortality was calculated according to the following equation and the insecticidal effect was judged according to the criterion shown below. The test was carried out with triplicate groups of 10 insects.

	[Number of hatched insects] [Number of hatched insects]	
Corrected mortality (%) =	in untreated group J in treated group J	X 100
Corrected mortality (76) =	[Number of hatched insects in untreated group]	X 100

[0140] The results obtained are shown in Table 4.

Test Example 2

Insecticidal effect on common cutworm (Spodoptera Litura)

[0141] A piece of cabbage leaf (cultivar; Shikidori) was immersed for about 30 seconds in a liquid chemical prepared by diluting a preparation containing each compound listed in Table 1 as an active ingredient to adjust the concentration to 500 ppm. After air-drying, it was placed in a plastic Petri dish with a diameter of 9 cm and inoculated with second-instar larvae of common cutworm, after which the dish was closed and then allowed to stand in a room thermostated at 25°C. Eight days after the inoculation, the dead and alive were counted. The mortality was calculated according to the following equation and the insecticidal effect was judged according to the criterion shown in Test

Example 1. The test was carried out with triplicate groups of 10 insects.

[0142]

35

[0143] The results obtained are shown in Table 4.

45 Test Example 3

Insecticidal effect on rice leafroller (Cnaphalocrocis medinalis)

[0144] The lamina of a rice plant at the 6 to 8 leaf stage was immersed for about 30 seconds in a liquid chemical prepared by diluting a preparation containing each compound listed in Table 1 as an active ingredient to adjust the concentration to 500 ppm. After air-drying, the lamina was placed in a plastic Petri dish with a diameter of 9 cm whose bottom had been covered with a wetted filter paper. The lamina was inoculated with third-instar larvae of rice leafroller, after which the dish was allowed to stand in a room thermostated at 25°C and having a humidity of 70%. Four days after the inoculation, the dead and alive were counted and the insecticidal effect was judged according to the criterion shown in Test Example 1. The test was carried out with triplicate groups of 10 insects.

[0145] The results obtained are shown in Table 4.
